

MOVEit® Mobile

Productivity for your mobile work force AND protection for your organization

MOVEit MOBILE

Enables mobile users to participate in business processes

Supports most popular devices and native applications

Visibility and control of mobile file transfers by central administrator

MOVEit Mobile enables mobile workers to reliably and productively participate in file-based business process workflows, while providing IT the security, visibility and control required to confidently run their business and meet compliance requirements.

Enables mobile users to participate in business processes

Familiar MOVEit secure file transfer capabilities are available for mobile users, such as:

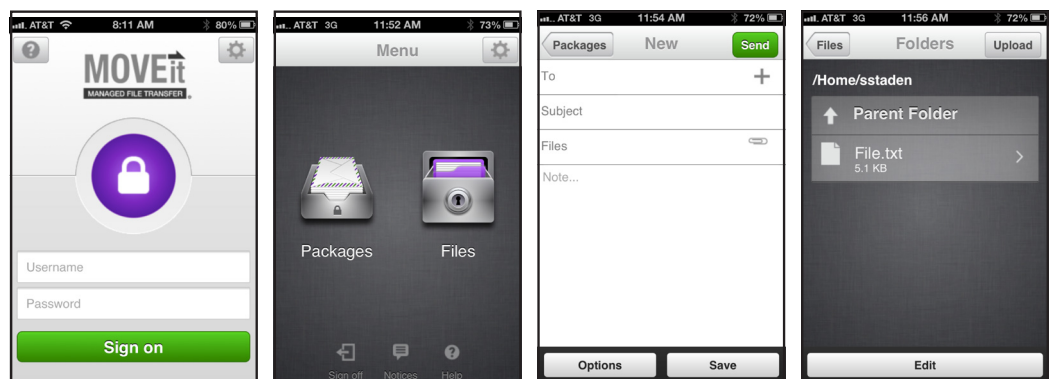

- › Access and transfer files
- › Send and receive packages
- › Secure sign-on and basic account management
- › Person-to-person transfers
- › Participate in automated workflows

Supports most popular devices and native applications

- › iOS devices including iPhone and iPad
- › Android devices including Nexus and Galaxy
- › Integration with device applications
- › Capture and securely share photos taken on the device

Visibility and control of mobile file transfers by central administrator

- › Visibility and control over all file transfer processes
- › Control mobile user access and enable single sign-on via SAML 2.0 integration to Identify Provider systems
- › Create and manage automated tasks and workflows
- › Audit and reporting on all file transfer activities
- › Custom brand the MOVEit app to reflect organizational branding

Insurance

An insurance adjuster can securely transfer documents and images from his tablet using MOVEit Mobile. And, while still at the accident site, he can initiate the automated insurance claim review workflow process, saving time and improving productivity. In the past, he would need to either wait until he returns to the office to securely access internal systems, use a complex FTP client from a remote desktop, or mail documentation within a paper-based process.

Healthcare

A doctor takes a picture of a patient's infection with her cell phone and sends it securely as part of a patient record update process. The medical records department is alerted to the availability of the picture, adds text information like the medical record number, uploads it to the patient record, and sends the picture to the practice management system. The pictures are made available to assisting specialists within the practice and instantly offer important context for collaborative treatment not previously possible. The process is in compliance with HIPAA/HITECH standards.

Distribution

A sales rep at a customer site securely generates and delivers an approved price quote document, initiating the process from her tablet. Once approved, the price quote is automatically and securely delivered to her client and the internal business systems are updated with information from the quote. The automated process reduces time for quote generation and approval, and ensures security for sensitive pricing and customer information in every step of the process.

Oil and Manufacturing

An engineer securely accesses shared large unstructured data files such as geo-physical information, equipment specifications or designs remotely on their tablet. The engineer can be anywhere in the world, and with MOVEit Mobile can securely view and edit any file he is authorized to access right from his iPad or Android tablet. User access is centrally managed, shared files can be created via an automated process, and files automatically delete on a pre-determined expiration date. Previously, engineers had to carry paper copies of documents, anticipate before they departed their office which electronic documents they might need while in the field, or make a second expensive return trip. And, if files needed to be updated based on information collected in the field, it required an interim step rather than being updated on the spot.

Finance

Executives and managers in financial services companies need secure access to critical financial and portfolio information. As mobile computing becomes ubiquitous, there are similar expectations for doing business from mobile devices. Protection of sensitive financial information is a concern. MOVEit Mobile allows executives to view sensitive financial documents and reports from their mobile devices without any unencrypted files stored on their device. Even better, financial reports can be automatically generated and securely transferred to appropriate executives – and if the files are not accessed within a pre-determined timeframe, they are automatically deleted, or can be automatically deleted after a pre-set number of views. MOVEit Mobile frees executives to do business wherever they are: at a client location, on a business trip, or even on the way home from work. Previously, they were chained to their desk or forced to put sensitive information at risk using unsecured systems.
